Date: 12/22/2022
From: Chuck Gregory, PE - Principal
Project Name: PGE Tonquin Substation
AKS Job No.: 8464
Project Site: 12150 SW Tualatin Sherwood Rd. Tualatin OR, 97140
Subject: **PGE Tonquin Substation - Stormwater Memorandum**

1.0 Purpose of Memorandum

This memorandum analyzes the effects of the proposed site improvements with respect to the existing and proposed stormwater conveyance system. Evaluation of the stormwater system includes documentation of regulatory criteria, methodology, and informational sources used to design/evaluate the stormwater system. The results of the preliminary hydraulic analysis are presented.

2.0 Regulatory Design Criteria

2.1 Stormwater Quantity

Per *Clean Water Services (CWS) Design and Construction Standards Manual for Sanitary Sewer and Surface Water Management (R&O 19-05), Section 4.02, Quantity Control Requirements for Conveyance Capacity*; on-site detention for conveyance capacity (25-year storm event) is required when any of the following conditions exist:

1. *There is an identified downstream deficiency and the District or City determines that detention rather than conveyance system enlargement is the more effective solution.*
2. *There is an identified regional detention site within the boundary of the development.*
3. *Water quantity facilities are required by District-adopted watershed management plans or adopted subbasin master plans.*

Per CWS standards, the stormwater facilities must be designed to detain the subject site's post-developed 25-year storm event peak flow to the site pre-developed 25-year storm event peak flow.

2.2 Stormwater Hydromodification

Per *CWS R&O 19-05, Section 4.03, Hydromodification Approach Requirements*; stormwater hydromodification is required unless the project meets any of the following criteria:

1. *The project results in the addition and/or modification of less than 12,000 square feet of impervious surface.*
2. *The project is located in an area with a District approved subbasin strategy with an identified regional stormwater management approach for hydromodification.*

Per listed criteria in the Hydromodification Approach Project Category Table 4-2, the subject project is identified as Category 3. Therefore, the subject project will meet CWS hydromodification requirements by providing peak-flow matching detention, using the design criteria established within CWS Section 4.08.6.

2.3 Stormwater Quality

The proposed project must meet CWS stormwater quality standards, providing stormwater treatment to all impervious surface's runoff. Stormwater quality management for this project will be provided by an

extended dry basin as well as stormwater filter cartridges. The stormwater facilities have been designed per CWS standards as established in section 4.04.

3.0 Design Methodology

The Santa Barbara Urban Hydrograph (SBUH) Method was used to analyze stormwater runoff from the site. This method utilizes the SCS Type 1A 24-hour design storm.

4.0 Design Parameters

4.1 Design Storms

Per CWS requirements, the following rainfall intensities and durations were used in analyzing the existing and proposed hydrologic site conditions:

Table 4-1: Rainfall Intensities		
Recurrence Interval (Years)	Storm Period (hours)	Total Precipitation Depth (Inches)
WQ	4	0.36
2	24	2.50
5	24	3.10
10	24	3.45
25	24	3.90

4.2 Pre-Developed Site Conditions

4.2.1 Site Topography

Existing on-site grades vary from $\pm 1\%$ to $\pm 50\%$, with a high point of ± 250 feet near the southwest corner of the site and a low point of ± 233 feet near the northwest corner of the site. The site slopes from south to north.

4.3 Soil Type

The soils beneath the project site and the associated drainage basins consist of medium dense to very dense gravel with varying amounts of clay, silt, and sand. Soil also consists of cobbles and boulders, dense silt sand with gravel. Weak to medium strength weathered basalt was also encountered. Soils underlying the site classify as Hydrologic Soil Group D.

4.4 Post-Developed Site Conditions

4.4.1 Site Topography

The onsite slopes will be modified with cuts and fills to accommodate the construction of the drive aisles and substation's gravel pad.

5.0 Stormwater Analyses

5.1 Proposed Stormwater Quality Management

Stormwater quality for the proposed project will be provided via one extended dry basin and two stormwater filter cartridge catch basins, designed per CWS Design and Construction Standards.

The water quality volume will be routed through the proposed extended dry basin and stormwater filter cartridges which will provide water quality treatment per CWS standards.

5.2 Stormwater Hydromodification Management

The proposed project will generate approximately 3.4 acres of impervious area, thus classifying as a Large Project. Per CWS Hydromod Planning Tool, the subject site is located within an expansion area and eventually drains into a low-risk level existing stream. Based on these parameters and CWS Table 4-2, the subject project is within Category 3 Hydromodification Approach.

Per CWS Category 3, the subject site will provide peak-flow matching detention, using design criteria in CWS Section 4.08.6. Specifically, the subject site's post-developed 2-year storm event runoff flows will not exceed 50% of the site's pre-developed 2-year storm event runoff flows and will be less than or equal to the 5-year, 10-year, and 25-year flows.

The site will utilize an extended dry basin as well as underground chamber trenches for stormwater detention.

Recurrence Interval (Years)	Peak Pre-Development Flows (cfs)	Peak Post-Development Flows (cfs)	Peak Flow Increase or (Decrease) – (cfs)
2	*0.39	0.39	0.00
5	1.17	0.74	(0.43)
10	1.41	1.03	(0.38)
25	1.72	1.67	(0.05)

*Peak pre-developed flow for 2-year storm event is calculated by subtracting 50% of the subject site peak flow from the total pre-developed peak flow.

5.3 Downstream Analysis

Stormwater runoff from the project site will be conveyed and directed into the existing public storm system located within SW Blake St. From there, runoff is directed west into the storm system located within SW 124th Ave.

A quarter mile downstream visual investigation of the storm system was performed, and no evidence of stormwater system conveyance capacity issues were found.

If you have any questions, please call or email.

Sincerely,

AKS ENGINEERING & FORESTRY, LLC

51.0" Wide + 6.0" Spacing = 57.0" C-C Row Spacing

2 Chambers/Row x 7.12' Long +0.81' Cap Length x 2 = 15.86' Row Length +12.0" End Stone x 2 = 17.86' Base Length

2 Rows x 51.0" Wide + 6.0" Spacing x 1 + 12.0" Side Stone x 2 = 11.00' Base Width

6.0" Base + 30.0" Chamber Height + 6.0" Cover = 3.50' Field Height

4 Chambers x 45.9 cf = 183.8 cf Chamber Storage

687.5 cf Field - 183.8 cf Chambers = 503.7 cf Stone x 30.0% Voids = 151.1 cf Stone Storage

Chamber Storage + Stone Storage = 334.9 cf = 0.008 af

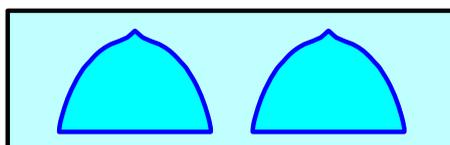

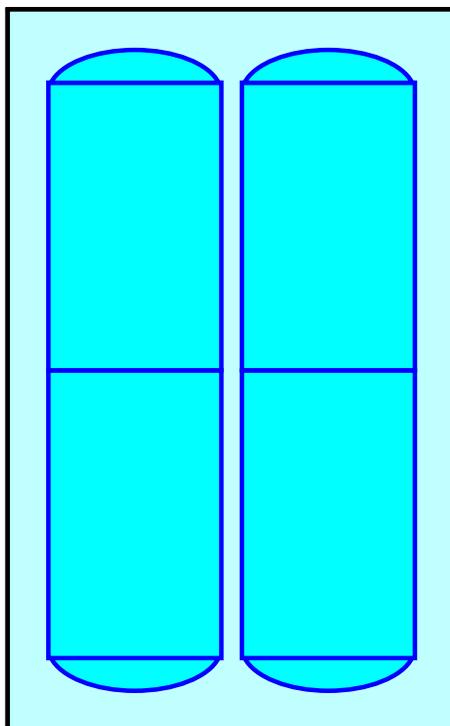

Overall Storage Efficiency = 48.7%

Overall System Size = 17.86' x 11.00' x 3.50'

4 Chambers

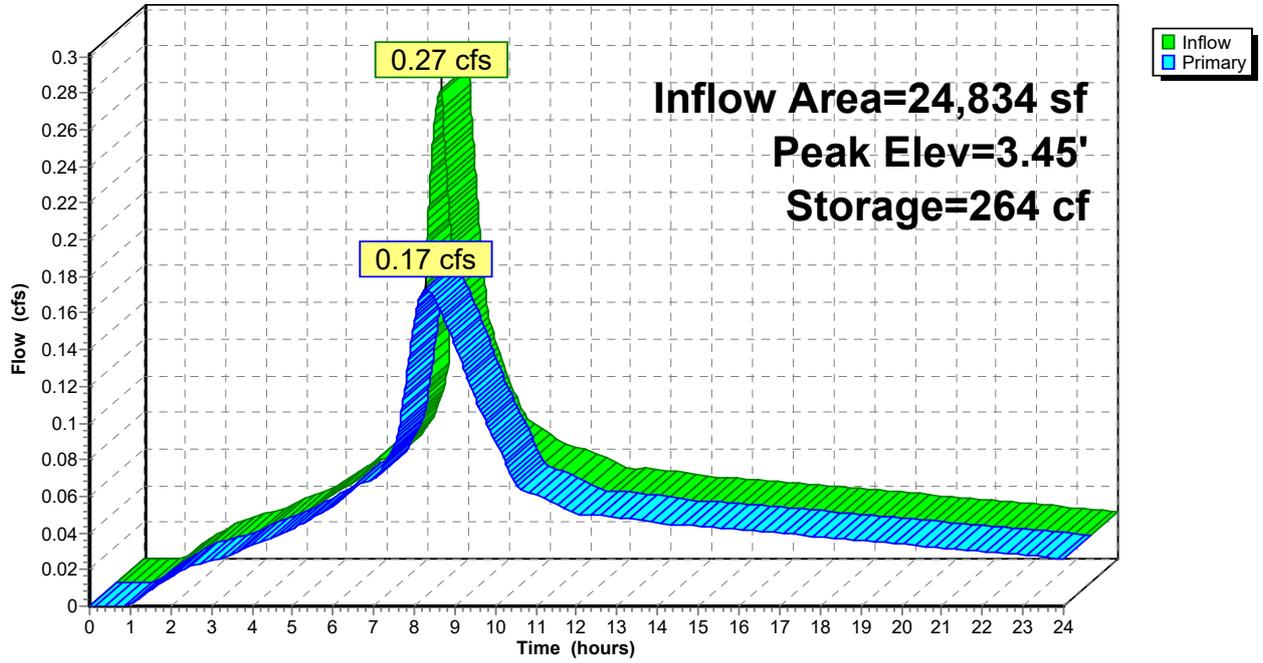

25.5 cy Field

18.7 cy Stone

Pond ST1: ST-740 CHAMBERS

Hydrograph

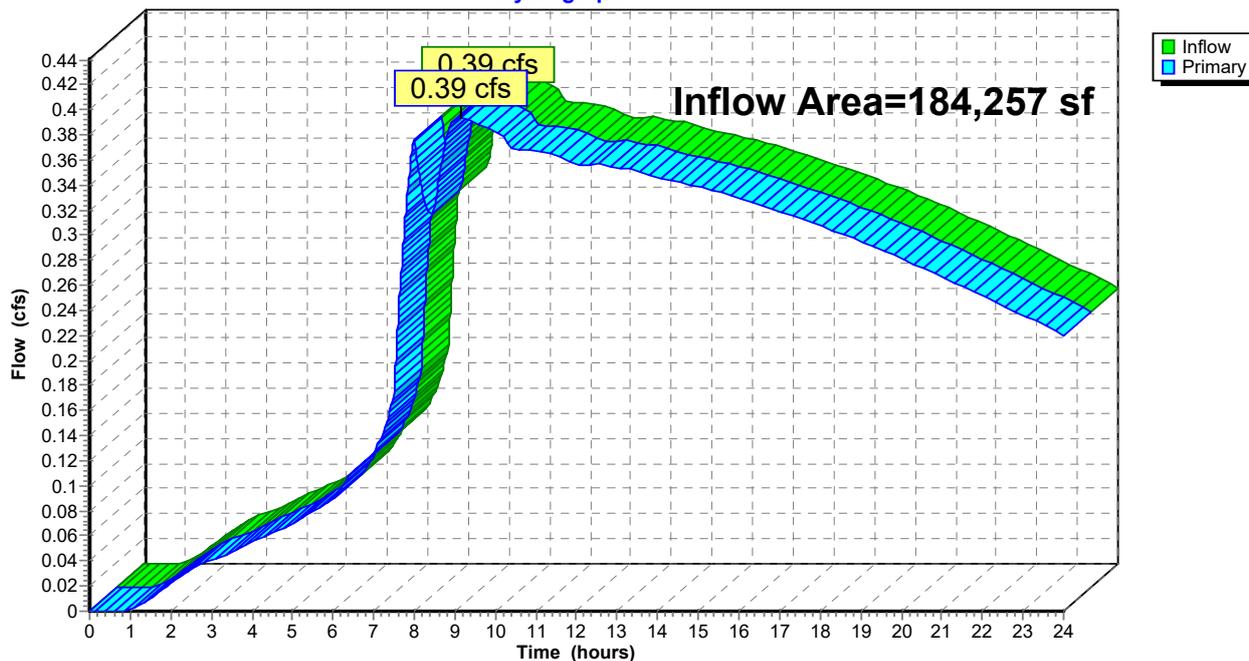

Summary for Link 1L: TOTAL

Inflow Area = 184,257 sf, 77.29% Impervious, Inflow Depth > 2.55" for 25-Year event
Inflow = 1.67 cfs @ 8.29 hrs, Volume= 39,143 cf
Primary = 1.67 cfs @ 8.29 hrs, Volume= 39,143 cf, Atten= 0%, Lag= 0.0 min

Primary outflow = Inflow, Time Span= 0.00-24.00 hrs, dt= 0.01 hrs
